CONCLUSIONS

Since there are many products on the market, it becomes a difficult task to dentists to select dental materials.

Even though mechanical tests have not reached the level of clinical simulation, they represent an important parameter of analyses. The knowledge of the principal laboratory tests is of high importance. There are many mechanical tests to evaluate dental materials, each of them with their characteristics and parameters. This subject is interesting for researchers seeking for the comprehension of the large variety of the available tests. In this manner, this article is of paramount importance since it informs and comments on the variety of scientific approach to evaluate mechanical properties of dental materials.
