8 CONCLUSIONS

The method of compression that introduced in this paper can be considered an important method in database processing such as data mining when the time of data access and memory storage optimization is very important, a proposed examples to show the compression ratio depended on the types of database repetition that occur in database and the size of data, as the size of data increased the compression ratio of data will be increased. The compression ratio is very important in reducing the storage needed, and it is considered a very important step in data mining preparation before processing. By data compression, data can occupy a little memory as possible, and permit processor optimization to be effective at run time.
