5 CONCLUSIONS

The most obvious conclusion from this review of specialist BIM roles is that while there are a large number of BIM guides and standards, there is little standardisation. A plethora of different labels, terms and job titles are evident across the many documents available. Although many of the documents stem from common sources, the coordination of project roles across the different guidelines is limited. Multiple interpretations of the same roles and responsibility sets are evident, depending on the guidelines followed in each case. Nonetheless, despite this variety of naming and labelling, the roles defined generally fall into two project roles and two organizational roles—project BIM manager (or information manager) and BIM coordinator as project roles, and internal BIM manager and BIM modeller in the organizational roles. However, there are overlaps in many cases between how the roles are referred to and how they are defined, which may cause confusion for both clients and project teams when establishing project protocols and employing appropriate personnel.
