4. Discussion
In the present study, sucrose consumption was associated with the prevalence of ADHD among boys at 6 years of age, in a cross-sectional analysis adjusted for confounding factors. However, subsequent cross-sectional analyses, at 11 years of age, indicated there was no association in either crude or adjusted analyses. There was also no association between sucrose consumption and the incidence of ADHD between 6 and 11 years of age. The effect of changes in sucrose consumption between 6 and 11 years of age on the incidence of ADHD over the same period was zero, both in crude and in adjusted analyses, for boys and girls.
