Consumer perception

ABSTRACT

The mutual dependence of businesses and society has emphasized the growing importance of the concept of corporate social responsibility (CSR). Despite the fact that CSR has emerged as one of the leading management concerns worldwide, both businesses and academia have largely ignored its application in developing countries. This study aims to fill these gaps by examining consumer perceptions of CSR and their role in the relationships between consumers' ethical ideologies (i.e., idealism and egoism) and evaluations of a company's product offerings. An empirical study among Vietnamese consumers shows that consumers perceive CSR in four dimensions—economic, ethical, philosophical, and legal. Different ethical ideologies have different effects on consumer perceptions of CSR; for example, idealism positively affects these perceptions, whereas egoism's effect is negative. Furthermore, the perceptions of CSR fully mediate the relationships between idealism/egoism and product evaluation.

1. Introduction

The history of corporate social responsibility (CSR) dates back to as early as the 1950s, when businesses and academic researchers start exploring the relationship between business and society (Carroll, 1999). Scholars define CSR as a discretionary commitment from the company regarding its activities to give back to the society where the company operates (Carroll & Shabana, 2010), which implies maintaining an equitable and workable societal balance among the claims of the various stakeholders of an enterprise (Frederick, 2006).

The concept of CSR emerges in Western developed countries as a result of the concerns of investors, companies, and campaigners. Even though not studied in detail, some authors have highlighted the vital role of CSR in fighting poverty and acting reasonably in developing countries (Pataconi & Weisert, 2013; Visser, 2008). Due to the lack of constituencies and institutions providing social goods in general (Samy, Ogiri, & Bampton, 2015), CSR seems more important for developing countries than for their richer counterparts (Baughn, Bodie, & McIntosh, 2007; Khan, Lew, & Park, 2015). In fact, Lund-Thomsen, Lindgreen, and Vanhamme (2016) confirm that the lack of institutionalization of CSR leads to companies in developing countries engaging in socially irresponsible behavior. Socially irresponsible behavior generates negative

moral emotional responses toward companies and their products (Grappi, Romani, & Bagozzi, 2013).

Despite the growing emphasis on CSR in developing countries, national initiatives in the less developed countries are sparse (Hamm, 2012; United Nations, 2007). In fact, the extant research on CSR focuses mostly on the context of developed countries, with only a few empirical studies on the developing countries (Denni & Lasmono, 2010; Dobers & Halme, 2009; Fox, 2004; Pham, 2011; Ramasamy & Yeung, 2009). This study aims to fill the aforementioned gaps by examining (1) how consumers perceive the concept of CSR in a developing country and (2) whether perceptions of a company's CSR initiatives can influence consumers' responses about the company's product offerings, in the context of Vietnam. Specifically, this study examines the relationships between consumers' ethical ideologies, perceived CSR, and product evaluations.

The rest of the study is as follows. Section 2 provides a theoretical framework and set of hypotheses, which the empirical study in Section 3 tests. Section 4 discusses the results of this study and, finally, Section 5 presents a discussion concerning the conclusions and implications.

2. Theoretical framework and hypotheses development

2.1. Consumer ethical ideologies

Over the last few decades, the world has witnessed the growing concern for ethical issues in business practices (Al-Khatib, Vitell, & Rawwas, 1997; Ndubisi, Natarajan, & Chew, 2013), which requires a better

[☆] The authors thank Anh Thu Phan for fieldwork support in Vietnam, and Matthew Robson, Leeds University, for suggestions and comments on the manuscript.

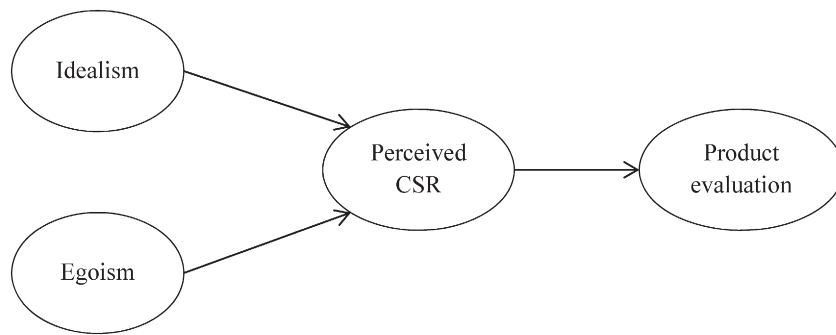

Fig. 1. Conceptual framework.

understanding of the individual decision-making process in situations that involve ethics and social responsibility (Vitell & Paolillo, 2004; Walker & Beranek, 2013). The literature indicates that ethical ideology is an important variable in the ethical decision-making process of consumers, influencing their judgments on the socially responsible activities of businesses and affecting their purchases (Al-Khatib, Stanton, & Rawwas, 2005; Panwar, Paul, Nybak, Hansen, & Thompson, 2014).

As such, the literature identifies two types of consumer ethical ideologies: *idealism* and *egoism*. Idealism describes “the individual’s concern for the welfare of others” (Forsyth, 1992, p. 462). Idealists assume that people can always obtain desirable consequences by taking the right actions; therefore, avoiding harm to others is always possible (Forsyth, 1980, 1992). People with a high level of idealism usually follow universal moral absolutes when making ethical judgments; thus, they appear to be more negative toward unethical behaviors (Forsyth, 1992; Rawwas, Vitell, & Al-Khatib, 1994). In other words, more idealistic consumers are more likely to perceive ethics and social responsibility as important in business practices (Vitell & Paolillo, 2004). In addition, Kolodinsky, Madden, Zisk, and Henkel (2010) find that idealism has a positive relationship with CSR, whereas materialism has a negative relationship to CSR evaluations. Idealistic people avoid harming others; thus, they tend to strictly follow moral rules when judging the behaviors of a company or product (Al-Khatib et al., 1997; Forsyth, 1992; Vitell & Paolillo, 2004). People with a high level of idealism are likely to have enhanced perceptions and be more aware of CSR as an important business practice (Vitell & Paolillo, 2004).

H1. Idealistic perspectives positively influence consumer perceptions of CSR.

Egoism refers to “the excessive concern with one’s own pleasure or advantage at the expense of community well-being” (Weigel, Hessing, & Elffers, 1999, p. 349), and is the most relevant variable for assessing the relationship between individuals and society compared to other variables that also reflect self-gratification behaviors, like selfishness, idiocentrism, and ethnocentrism (Weigel et al., 1999). The literature suggests that egoism is a potential ethical ideology that can have an effect on consumer ethical perceptions (Leonidou, Leonidou, & Casova, 2013). According to the egoistic perspective, an act is ethical only when promoting an individual’s best long-term interests. Consequently, the ethical alternative that egoists would choose is the one that brings more good than harm to themselves in the long run (Vitell & Paolillo, 2004). In contrast with idealistic perspectives, egoistic perspectives prioritize individual’s long-term self-interest over community well-being (Leonidou et al., 2013; Weigel et al., 1999). Egoistic consumers only support the CSR activities of a company if they find themselves directly benefiting from such activities (Morales, 2005; Reed, Aquino, & Levy, 2007; Russell & Russell, 2010). Otherwise, these consumers tend to be indifferent to the ethicality/unethicality of business practices (Hansen, 1992; Reidenbach & Robin,

1988). Further, consumers show egocentric bias toward a company when they perceive the company’s actions to be benefitting their particular in-group(s) (Russell & Russell, 2010).

H2. Egoistic perspectives negatively influence consumer perceptions of CSR.

2.2. Corporate social responsibility and consumer product evaluation

Many scholars have examined product evaluation in their efforts to understand the effects of consumer perceptions of CSR (e.g., Branco & Rodrigues, 2006; Brown & Dacin, 1997; Sen & Bhattacharya, 2001; Swaen & Chumpitaz, 2008). Swaen and Chumpitaz (2008) reveal that the positive corporate reputation gained through CSR can determine the perceived quality of products and services. This finding supports Brown and Dacin’s (1997) conclusion that positive CSR associations with a company that fulfills its societal obligations (e.g., to save the environment or involve itself in the local community) can generate positive company evaluations from consumers, which in turn bring about positive product evaluations. Similarly, Branco and Rodrigues (2006) find that CSR can help companies create a reliable and honest image, which they believe helps them produce higher quality products. In a study of Chinese consumers’ responses to CSR, Tian, Wang, and Yang (2011) conclude that consumers that show a high level of awareness and trust of CSR are more likely to transform a good CSR record into positive corporate evaluation, association, and purchase intention. Further, Dutta and Singh (2013) reach the same conclusion in a study conducted in India.

Whether consumers hold positive or negative assessments of a company’s products may depend on the nature of the CSR initiatives the company carries out. According to Brown and Dacin (1997) “negative CSR associations ultimately can have a detrimental effect on overall product evaluations, whereas positive CSR associations can enhance the product evaluations” (p. 80). In addition, Sen and Bhattacharya (2001) argue that the effect of consumer perceptions of CSR on company and product evaluations is valence-based, where negative CSR is a concern of the public, whereas positive CSR only receives support from the most passionate advocates. This concept refers to people’s tendency of negativity bias, or being more sensitive to negative issues than to positive ones (Bhattacharya & Sen, 2004; Folkes & Kamins, 1999; Mohr & Webb, 2005; Sen & Bhattacharya, 2001). (See Fig. 1)

H3. Consumer perceptions of CSR have a positive association with their product evaluations.

H4. Consumer perceptions of CSR mediate the effect of idealism and egoism on product evaluations.

Table 2
Factor analysis of consumer perceptions of corporate social responsibility.

Dimensions of social responsibility	Factor loadings			
<i>Factor 1: legal responsibility</i>	F1			
A company's activities should comply with various state and local laws and regulations.	0.884			
A company should be concerned with fulfilling its legal obligations.	0.828			
The products/services of the company should meet legal requirements.	0.701			
<i>Factor 2: philosophy responsibility</i>	F2			
A company should voluntarily participate in charitable projects for the disadvantaged.	0.865			
A company should actively sponsor social events (cultures, arts, sports...).	0.809			
A company should direct parts of its revenues to donate to charities.	0.783			
A company should be concerned with the enhancement of a society's quality of life.	0.713			
<i>Factor 3: ethical responsibility</i>	F3			
The company should recognize and respect new or evolving ethical/moral norms that the society may adopt.	0.830			
A company's behaviors should be consistent with the expectations of societal moral and ethical norms.	0.728			
A company should try to monitor the negative effects of its business on the community.	0.608			
<i>Factor 4: economic responsibility</i>	F4			
A company's objective is to maximize profit during its activity.				0.779
A company should try to improve its economic performance.				0.772
A company should try to maintain a strong competitive position.				0.674
Eigenvalue	4.40	2.00	1.46	1.08
Variance (%)	33.82	15.38	11.23	8.27
Cumulative variance (%)	33.82	49.20	60.43	68.70
Cronbach's alpha	0.81	0.83	0.66	0.63

p. 78). Hence, researchers now extensively study CSR, exploring from different perspectives of governance, businesses, and consumers and conceptualizing as four responsibilities—economic, legal, ethical, and philanthropic—in which the first enjoys the highest priority. Many researchers hypothesize that ethical ideologies, including idealism and egoism, have the opposite effects on consumer perceptions of CSR, in the sense that a higher level of idealism and lower level of egoism correspond to a higher level of perceived CSR. Furthermore, a large body of literature discusses the effects of a company's social behaviors on consumers' evaluations of that company and its products. These evaluations, in turn, will affect consumers' intentions to buy the products.

Both business and academia have extensively studied consumer perceptions of and responses to companies' CSR initiatives. Due to the lack of constituencies and institutions providing social goods in general, many researchers view CSR adoption as more important for developing countries than for developed ones. Even though a consensus exists that CSR in developing nations lags behind that in developed ones (Tran, 2011), researchers do not pay sufficient attention to the application of CSR in developing countries, such as Vietnam. Therefore, this study, with focus on Vietnamese consumers, identifies consumer perceptions of CSR among developing countries, and explores consumer responses to the CSR initiatives of companies.

5.1. Theoretical implications

The findings from this research reveal both similarities and differences in the manifestation of CSR in Vietnam, when compared to other countries. Because Vietnam is a collectivistic nation, consumers share a higher level of idealism than egoism, leading to a relatively high level of perceived CSR importance. In addition, Vietnam has slightly modified the application of CSR, because legal responsibility appears to be the area of highest concern. The reason for this rise in perceived importance of CSR in general, as well as legal responsibility in particular, lies in public attention drawn to a number of recently disclosed misconducts of various companies. Regarding the effects of a company's CSR strategy on consumer behavior, this study's findings are consistent with those of previous studies carried out in the global context. That is, the judgements of the CSR activities of a company can affect consumers' evaluations of the company's products. Not surprisingly, Vietnamese consumers also harbor a negative bias, being more sensitive to negative CSR than to positive. As a result, they have formed the attitude of punishing unethical companies by stopping and asking others

to stop buying products from environmental polluters, and rewarding ethical companies with their willingness to pay higher prices for the products. Nonetheless, these consumers seem to need time to translate these attitudes into actual actions.

In general, the findings provide several key theoretical implications. First, two ethical ideologies—idealism and egoism—exert opposite effects on consumer perceptions of CSR, in the sense that a higher level of idealism and lower level of egoism in a particular developing country accompanies a higher level of perceived CSR. According to Hofstede's (1983) cultural dimensions, Vietnam is a low scorer on the Individualism dimension ($IDV = 20$), which may explain why Vietnamese consumers have idealistic, rather than egoistic, perspectives. With a relatively high level of idealism and low level of egoism, they perceive CSR as an important concept for businesses to consider.

Second, this study proves a positive relationship between consumers' judgements of a company's CSR behaviors and their evaluations of its product offerings. Companies that are doing good deeds for society receive positive product evaluations, whereas companies that are doing harm to society receive negative ones.

Third, the results imply that idealism and egoism influence product evaluation via consumer perceptions of CSR. In fact, as Berens, van Riel, and van Reom (2007) conclude, idealistic consumers may continue to buy from companies with a good CSR record even when the product quality may be relatively poor. On the other extreme, while idealistic consumers may compensate for relatively poor product quality when they perceive the company as socially responsible, egoistic consumers may compensate poorer CSR standards for better product quality. Thus, consumer attributions relating to idealism and egoism influence product evaluation via consumers' CSR evaluations (Ellen, Webb, & Mohr, 2006).

5.2. Managerial implications

Additionally, this study's findings provide a number of significant implications for both managers and the government. First, in order to improve the CSR strategies of companies, policymakers should consider consumers' prioritization of legal responsibility in relation to business practices. Some people claim the poor management of authorities and loopholes in the legal system as reasons for the unethical conduct of companies. Therefore, the public has emphasized the need for more stringent laws and regulations for companies' activities. Governments should resolve the burgeoning issue of environmental protection with strict requirements on waste and emission processing, certification of

environmental impacts of products, and, more importantly, penalties for environmental polluters. So far, the Vietnamese government has shown support for the CSR initiatives of businesses by treating some categories of donations—including disaster, education, and medical practice support—as deductible for the corporate income tax. However, claiming the tax deduction is a time-consuming process, requiring considerable supporting documentation, which causes confusion and difficulty for businesses. Therefore, to encourage businesses in the implementation of societal activities, the need for improvements clearly exists. In addition, regulations should cover areas concerning consumer rights—such as after-sales services, guarantees, and product information provisions.

Second, companies should note that consumer perceptions of CSR significantly influence product evaluation. Therefore, companies should pay more attention to the disclosure of CSR credentials and incorporate CSR initiatives into their integrated marketing communications and branding strategies, which will help increase the effectiveness of CSR campaigns and send a message to consumers about the companies' genuine concerns for societal problems. More importantly, instead of conducting the untargeted promotion of CSR practices, companies should focus on selected issues that closely correspond to their missions and capabilities, as well as public interests. In order to raise public awareness, companies themselves can undertake activities, such as donating to victims of natural disasters and establishing education funds for disadvantaged children in remote areas. However, companies can garner the most publicity if they also get consumers' participation in their various societal campaigns, such as health care projects (oral care, eye care, etc.) and environmental protection campaigns (planting trees, recycling, saving water and electricity, etc.). Therefore, more marketing research is necessary for companies to be able to identify the most recent and relevant areas of public interest. Since consumers can recognize certain congruence between a company's initiatives and important considerations, companies would more easily attract and retain customers.

5.3. Limitations and future research

This study inevitably faces some limitations that would necessitate further research. First, the model should consider some moderators. For instance, the economic and educational gaps between urban and rural consumers are considerably large; thus, future research should extend to more consumers in different geographic locations, especially those living in rural areas. Second, future studies should also consider a better representation of the different age groups. Third, studies should explore consumers' reactions to the CSR initiatives of companies regarding different industries, companies, products, or brands, due to the differences in consumers' needs for different product categories. Fourth, the effect of CSR on different outcome variables such as company evaluation could help researchers to compare the effects on both company and product evaluation, and to explore the relationship between them. In conclusion, this study examines whether consumers appreciate and use their perceptions of CSR during the decision-making process, and finds that different ethical ideologies influence these perceptions and, in turn, consumers' product evaluations.
