5 Conclusion

This research has developed a neural network model to help in the diagnosis of pregnant women whether they have diabetes or not. The developed model has also been incorporated into a web based application for easy accessibility. As such, health workers or patients at remote locations can access the system, enter patient data in real time and communicate the diagnosis without having to be around the patient.

Some recommendations for its advancement include a Mobile Platform. The system is on a web-based platform at the moment but it would be more beneficial if the system can be based on mobile platforms where there can be offline access on phones, and other devices.
